

Table 1

1		
2		

Table 2

1		
3		

Left Join

1				
2				

SELECT column names

FROM table1

LEFT JOIN table2

ON table1.common_column = table2.common_column;

Here are the **customers** and **sales** tables from our bookstore.

Customers

id	first_name	last_name	gender	age	customer_since
1	Daniel	Black	M	34	2014-10-13
2	Erik	Brown	M	25	2015-06-10
3	Diana	Trump	F	39	2015-10-25
4	Anna	Yao	F	19	2017-02-20
5	Christian	Sanders	M	42	2018-01-31

Sales

id	date	book_id	customer_id	quantity	amount
1	2019-09-02	2	3	1	14.99
2	2019-10-01	1	2	1	12.99
3	2019-10-01	3	4	1	15.75

To join these two tables and obtain the information we need for analysis, use the following SQL query:

```
SELECT c.id, c.first_name, c.last_name, c.gender, c.age, c.customer_since,
    s.date AS sales_date, sum(s.amount) AS total_spent
FROM customers c
LEFT JOIN sales s
ON c.id = s.customer_id
GROUP BY c.id;
```
